

USAi Administrator Guide

System Configuration Options

Introduction

Welcome to USAi. As an administrator, you have elevated system access that enables you to manage and configure several aspects of the product at your agency. This guide provides instructions on managing user permissions, large language models, API keys, and system prompts.

General Overview

USAi consists of a web-based Chat application, along with resources and Administrative functions. The web interface also provides approved users with the ability to create and manage USAi API keys, providing programmatic access to AI services for government users and approved partners.

System Configurations

Options for configuring your agency's USAi environment are located under the **Configurations** menu in the **Console**.

User Permissions (Groups)

Access levels within the platform are determined by membership in specific **Groups**. Upon agency onboarding, all users that authenticate into the platform via your single sign-on solution are automatically assigned to the **Default-User** group.

Users within the **Admin** or **Group-Manager** groups have the authority to manage memberships. Available groups and their respective permissions are detailed in the Groups Manager page and listed below.

Groups Manager

Group Name	Description
API-Key-Admin	Can manage API keys for any user within the agency
API-Key-User-Short-Term	Can manage their short-term API keys
Admin	Can manage Groups, API keys, system prompts, models, and API budgets
Default-User	Can access Chat, Console, and API documentation
Group-Manager	Can manage Groups
Model-Manager	Can manage agency model availability and default model

Models Manager

The **Models Manager** section allows **Admins** and the **Model-Manager** Group to manage which large language models are available to users within their agency, whether they are available via API or Chat, and which model is set as the default. You can enable or disable specific models based on agency needs, security requirements, or cost considerations by using the checkboxes.

Model Cards and Evaluation data are available in the Console to help agencies understand the costs, trustworthiness, and relative strengths of each model.

More detailed trustworthiness analysis of the Azure models (GPT, Grok) are available in the USAi security folder.

API Key Management

Admins and users in the **API-Key-Admin** group have access to **API Key Management**. This interface allows the ability to rotate, revoke, or delete all API keys within an agency. For example, if someone accidentally checks an API key into GitHub and it needs to be deactivated, someone is out of the office and needs an API key rotated, or someone left the agency and we need to disable all their API keys.

System Prompts

System Prompts provide the baseline instructions and behavioral guidelines for the AI models used at your agency. Administrators can configure these prompts to align the AI's responses with specific agency protocols, ensuring a consistent and professional user experience across the platform. To manage system prompts, navigate to the **Prompt Manager** section. The default USAi System Prompt is read-only and cannot be modified. It contains platform-wide guardrails, model tooling instructions, and configuration settings that ensure the platform operates safely and consistently.

To customize AI behavior for your organization, add agency-specific instructions in the editable section. These instructions are applied in addition to the default USAi System Prompt.

Other configuration options

Certain configuration options, such as limiting document upload capabilities and web grounding features, require coordination with the USAi core team for implementation. Please [contact us](#) for assistance with these settings.
